

Exercício de fixação

Em um novo programa, inicie as seguintes variáveis:

```
String product1 = "Computer";
String product2 = "Office desk";

int age = 30;
int code = 5290;
char gender = 'F';

double price1 = 2100.0;
double price2 = 650.50;
double measure = 53.234567;
```

Em seguida, usando os valores das variáveis, produza a seguinte saída na tela do console:

```
Products:
Computer, which price is $ 2100,00
Office desk, which price is $ 650,50

Record: 30 years old, code 5290 and gender: F

Measue with eight decimal places: 53,23456700
Rouded (three decimal places): 53,235
US decimal point: 53.235
```

(correção na próxima página)

```
import java.util.Locale;

public class Main {

    public static void main(String[] args) {

        String product1 = "Computer";
        String product2 = "Office desk";

        byte age = 30;
        int code = 5290;
        char gender = 'F';

        double price1 = 2100.0;
        double price2 = 650.50;
        double measure = 53.234567;

        System.out.println("Products:");
        System.out.printf("%s, which price is $ %.2f%n", product1, price1);
        System.out.printf("%s, which price is $ %.2f%n", product2, price2);
        System.out.println();
        System.out.printf("Record: %d years old, code %d and gender: %c%n", age, code, gender);
        System.out.println();
        System.out.printf("Measue with eight decimal places: %.8f%n", measure);
        System.out.printf("Rouded (three decimal places): %.3f%n", measure);
        Locale.setDefault(Locale.US);
        System.out.printf("US decimal point: %.3f%n", measure);
    }
}
```
